1. Overview

In 2019, the gaming industry was worth \$148.8B. This is expected to increase to \$160B by the end of 2020. Upon further inspection, the global gaming market is projecting a 12% CAGR (Compound Annual Growth Rate) between 2020 – 2025. Developing an application for a steadily growing market will prove to be beneficial. This project is for developing "compete", a mobile application for the gaming community.

Compete, will be available on both Android & IOS. The app is centered around the gaming community. The main objective is to provide a unique platform where gamers can expand their communities, organize tournaments, and share content with each other. Thus, creating a hub for the gaming community to come back to whenever they think of anything associated with gaming.

2. Goals and Scope

2.1 Project Goals

The goal of this project is to build and successfully deploy a one-stop collaborative mobile-based application for the gaming community within a span of 12 months and provide users the ability to manage communities, tournaments, user and team profiles, leaderboards and share media content with each other. The platform shall adhere to the regulations of each respective mobile platform.

2.2 Project Scope

2.2.1 Included

The application will contain different types of accounts, regular users and administrators. It will provide users with the ability to create, manage, join, and search for tournaments as well as communities. Users will also be able to share multimedia content, manage their profiles and view leaderboards for different tournaments. Administrator accounts will be included to manage the entire system.

2.2.2 Excluded

The platform will not include:

- Games to be played but only functionalities such as the creation of tournaments and communities related to these games are included
- Compatibility with Harmony OS
- Compatibility with Windows Phone OS
- Recording of tournaments to be saved

2.3 Assumptions

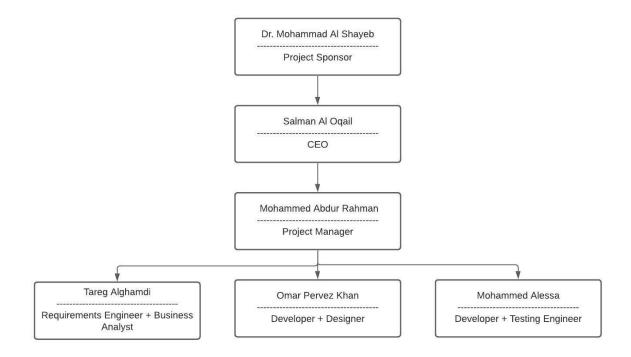

- Multiple programs will have access to the application to allow content sharing.
- Funding for licenses will be provided by the respective departments as per requirement.
- Project stakeholders and team members will always be available for meetings.
- Estimated expenditure throughout the project will remain the same as what was initially projected.

3. Project Organization

3.1 Project Organizational Structure

3.1.1 Project Team

| Team member | Role | Involvement duration | Comment |
|-----------------------------|--|----------------------|---------|
| Dr. Alshayeb | Project Sponsor | 12 months | |
| Mohammed Alessa | Developer + Tester | 12 months | |
| Salman Aloqail | CEO | 12 months | |
| Mohammed Abdur Rahman | Project Manager | 12 months | |
| Omar Pervez Khan | Developer + Designer | 12 months | |
| Tareg Alghamdi | Requirements Engineer + Quality Manager | 12 months | |

4. Schedule and Budget

4.1 Schedule and Milestones

The detailed schedule with their sequencing was done using Microsoft project which provides the following items:

- Work Breakdown Structure
- Work Packages
- WBS dependencies
- Milestones

The link to the Microsoft project file containing the items mentioned above has been referenced in the References section (2.4).

4.2 Cost and Budget

4.2.1 Cost Estimation

We have used two different approaches to cost estimation:

- 1. Bottom-up estimate
- 2. Analogous estimate

1. Bottom-up estimate

| | Bottom-up Estimate | | | | | | | | |
|---------------------------------------|---|------------|----------------------------|--|--|--|--|--|--|
| Work Package | Duration (Some days overlap) working days | Cost (SAR) | Cost rate per day (SAR) | | | | | | |
| 1 - Concept development | 50 | 178,571.5 | | | | | | | |
| Draft idea | 10 | 35,714.3 | 3,571.43 | | | | | | |
| Draft concept | 10 | 35,714.3 | 3,571.43 | | | | | | |
| Draft features | 10 | 35,714.3 | 3,571.43 | | | | | | |
| Must-haves | 3 | 10,714.29 | 3,571.43 | | | | | | |
| Nice to haves | 2 | 7,142.86 | 3,571.43 | | | | | | |
| Define main issue to solve | 3 | 10,714.29 | 3,571.43 | | | | | | |
| Draft Minimum Viable Product (MVP) | 4 | 14,285.72 | 3,571.43 | | | | | | |

5. Management Plans

5.1 Integration Management

5.1.1 Configuration Management Plan

Configuration management functions will be supported by the following tools:

- Git: Version Control System
- GitHub: Hosting Online Repositories for Source Code Management
- Datadog: Log Collection & Management Tool

Git

Git will be used to track any changes made to the configuration items. Branches will be used to work on new builds and releases to ensure isolation of any

volatile changes made.

GitHub

The repository for the product will be hosted on GitHub so that the team can effectively utilize Git and plan releases.

Datadog

Specifically, for use in the Test User Acceptance phase under the Release Management process, Datadog will be used to aggregate and log any unexpected issues that arise during the testing phases. This will help the development team identify pain points and rectify them immediately.

Method of Configuration Identification

Configuration identification will be performed in three stages, as follows:

- 1. Items to be placed under configuration control will be identified
- 2. Unique identifiers will be assigned that specify the configuration item and its version
- 3. Configuration items will be placed into their respective sections of the configuration control plan once assigned an identifier

Method of Configuration Control

Configuration control will consist of the following:

Change Requests

Changes to any configuration item will be requested through the Git Version Control System.

Change Evaluation

The impact of the change to the configuration item will be evaluated based on its perceived risk vs. benefit with respect to the budget, schedule, and other configuration items.

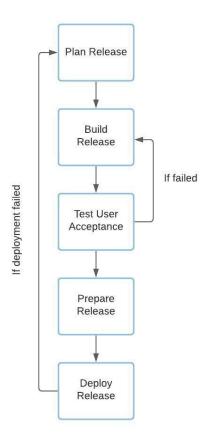

Change Approval/Rejection

Permission to change the item will be granted based on the evaluation of the change to the configuration item in the Change Evaluation. This permission will be granted by the Change Control Board (CCB) committee.

Release Management Process

The release management process will be used for the deployment of software products and documentation. The process is divided into 5 different phases:

- 1. Plan Release
- 2. Build Release
- 3. Test User Acceptance
- 4. Prepare Release
- 5. Deploy Release

Plan Release

During this phase, the entire plan of the release is created. This plan explains how the release is staged and includes requirements, timelines, and delivery dates.

Build Release

Once the release has been planned, the development and design of the product based on the requirements specified is conducted in this phase. For each build, a new branch in the git repository is created.

Test User Acceptance

In this phase, the current build will be deployed to a testing environment for user acceptance to identify any bugs or issues that may arise in a real-world environment. The build will be tested by giving a beta version to several of your employees. Any unexpected behavior will be logged through Datadog. As issues are identified, the build is sent back for development in the Build Release phase. Once the issues are fixed, the build is once again deployed to test for user acceptance.

The work may flow back and forth from the Build Release phase to the Test User Acceptance phase until the release is approved.

Prepare Release

In this phase, the team will conduct final checks to ensure the current build meets the requirements outline in the release plan. Once the review is completed, all findings are validated and finalized for the release and the build is marked as a minimum viable product.

Deploy Release

In this phase, the product is released into production. Users will be notified of any changes that have been made from the previous releases. The branch containing the build in the git repository is merged into the production branch. The performance of the release is evaluated and discussed. If the deployment was not successful, the process restarts from the first phase where the entire release is planned once again. Issues that arose during the deployment phase are considered.

If there are any minor issues found, they are identified and documented and will be addressed in the next release.

5.1.2 Change Management Plan

The process used to manage changes to the project will be as follows:

A change request must be created and submitted each time the client needs a change that will impact the project schedule. A change request will be sent to the Compete team through Slack. The Compete team will then process the change request, assess the feasibility of the change based on the risk and perceived benefit it accompanies, and the project manager will then approve or deny the change request.

If the change is denied, the team and the project manager will sign the change request indicating the agreement that no change is to be made. If the change is accepted, documents that reference the newly updated requirements will be modified to reflect the changes. The team, project manager and client will sign the change request indicating the agreement to the change.

Once a decision has been made, the change request will be documented in the Changes document entailing the team's decision regarding the request. Any changes or updates regarding the status of a change request will be made in the Changes document.

5.1.3 Delivery Plan

| Deliverable # | Deliverable | Planned Date | Receiver |
|---------------|-------------|--------------|----------|
|---------------|-------------|--------------|----------|

| D1 | Software Requirements Specification (SRS) | 1/1/21 | Project Sponsor |
|----|---|---------|---|
| D2 | High Fidelity Prototype | 3/3/21 | Project Sponsor |
| D3 | User Interface | 6/23/21 | Project Manager |
| D4 | Minimum Viable Product | 9/21/21 | Project Sponsor and Project Manager |
| D5 | Source Code | 9/25/21 | Project Sponsor |
| D6 | End-User Documentation | 9/25/21 | Project Sponsor |

5.2 Scope Management Plan

All changes and management activities with concern to the scope will be carried out by the Project Manager.

Proposed changes to the scope may be initiated by the Project Manager, Stakeholders, or any team member. Any request for change in project scope will be processed through the project's change management procedure. All scope change requests will be submitted to the Project Manager who will then evaluate the requested change. The change will be analyzed for its impact on project time and project costs, and a risk assessment of the scope change will be conducted.

The approval of the change request will be done by the Change Control Board (CCB) and the Project Sponsor. Once a change request has been approved, the Project Manager will update all effected project documents and relay the changes made to the scope to all stakeholders. The change will also be documented in the Change document. If the change request is declined, it is added to the Change document with the reasoning of its declination and the Project Manager will relay the decision made to all the stakeholders.

After being provided with feedback from the Project Manager, the Project Sponsor will be responsible for the acceptance of the final project deliverables and the project scope.

5.3 Procurement Management Plan

We have five major steps for a procurement process, which are:

5.3.1 Specification

In this step, the purchasing department will be allowed to communicate with the project manager to develop and approve a list of procurement items necessary for project implementation. The department will specify the approved items to external vendors.

5.3.2 Selection

In this step of the project procurement process, we will require the department to find potential suppliers which can procure the necessary items, according to the specifications. For this purpose, the department needs to set vendor selection criteria, which may include such measures as Delivery, Service Quality, Cost, and Past Performance.

5.3.3 Contracting

In this step the department will communicate with the suppliers to discuss delivery dates and payment conditions to ensure "on-time" delivery of the ordered items within the stated project budget.

5.3.4 Control

Through arranging regular meetings with the vendors, tracking delivery progress, reviewing the ordered items against the approved product specifications, and making necessary changes to the procurement contract, the department will control the process and ensure successful accomplishment.

5.3.5 Measurement

The final step of our procurement management process is using a system of performance indicators and measures for assessing the effectiveness and success of the entire process. The project manager will set up such a system and the purchasing department will use it in measuring the process. Special meetings and workshops will be conducted to view KPIs, intermediate results of staged delivery, adherence to product specifications, communications with suppliers, and the like. In case any deviations or gaps are revealed, the department will notify the project manager and make necessary changes to the procurement plan.

5.4 Schedule Management Plan

The project schedule will provide a roadmap for the team by providing all the required activities that will collectively achieve project goals and objectives. A detailed approach and methodology for proper schedule management and the roles and responsibilities of all the parties involved is provided in the two sections below.

5.4.1 Approach and Methodology

Defining tasks

Prior to the initiation of the project, the project manager will conduct a meeting with the assigned team to discuss the project deliverables. The team will follow an analogous approach to create a WBS, and the tasks will be ordered according to their priority at each level. Furthermore, milestones will be clearly defined to help the project manager and the stakeholders view the progress at the topmost level.

Assigning tasks

After creating the WBS, the team, with the assistance of the project manager, will assign work packages to resources. Each work package will be designated based on the technical knowledge, the experience, the communication skills, and the level of interest of the resource.

Estimating Task Duration

To accurately estimate each task duration, expert judgement, data analysis, and PERT analysis will be used. The project manager will consider the resource's estimation as well. The units of estimation will be in terms of days for work packages and weeks for higher level deliverables.

The formula for the PERT analysis is given below:

For the PERT analysis is given below:
$$Estimate = \frac{Optimistic + (4 * Most Likely) + Pessimistic}{6}$$

Sequencing Activities

Critical Path Method (CPM) along with Precedence Diagraming method (PDM) will be used to sequence all the tasks. This will determine the earliest time for Compete's completion.

Developing Gantt chart

After defining the activities with their estimated time duration and sequencing them, a Gantt Chart will be produced which will contain the full schedule of the project with their start and finish date, and the assigned resources for each work package.

Controlling Schedule

The change control Board will handle all the changes that may occur during the project timeline.

Scheduling Tools

Microsoft Project is the main project management tool that will be used to create the Gantt chart and the Work Breakdown Structure.

5.4.2 Roles & Responsibilities

| Name | Role | Responsibility |
|--------------------------|--|---|
| Mohammed Al Shayeb | Project Sponsor | Reviews & Approves schedule baseline and progress reports. |
| Salman Al Oqail | CEO | Provides status reports to the project sponsor. |
| Mohammed Abdur Rahman | Project Manager | Leads the team in developing the schedule management plan and the project schedule. |
| Omar Pervez Khan | Quality Manager + Requirements Engineer | Assists the project manager in creating the schedule management plan. Assists in developing activity duration estimates. Makes schedule change and risk recommendations to the project manager. |
| Tareg AlGhamdi | Developer + Designer | Assists in estimating schedule activities. Provides progress reports during the project (to the project manager) Notifies possible scheduling risks and issues during the project. |
| Mohammed Al Essa | Developer + Testing Engineer | Assists in estimating schedule activities. Provides progress reports during the project (to the project manager) Notifies possible scheduling risks and issues during the project. |

5.5 Cost Management Plan

Cost management is typically the project manager's responsibility. Cost management involves not only managing the budget, but also planning, and preparing for potential risks. Risks can set projects back and sometimes even require unexpected expenses.

5.5.1 Cost Estimation

The cost estimation will be done by using the Bottom-up estimate approach where the cost performance is measured by dividing the work-to-work packages, then summing all the packages to get the total cost. Furthermore, to eliminate bias towards underestimation, the project manager will consult other project managers of ongoing projects within the company that are similar to the project. All parties involved in the project will attend all meetings and work together to produce the cost

baseline. To help with better estimation, we will use the earned value management of previous projects and learn from their cost performance metrics.

5.5.2 Controlling Cost

To monitor and control the cost, we will use the cost management plan, conduct meetings, and use quality control (i.e. control charts, histograms, and cause and effect diagrams) methods. Monthly cost performance reports will be provided to the stakeholders and the project manager. If the cost baseline must be revised, both the project manager and Change Control Board (CCB) can approve budget changes.

5.6 Quality Management Plan

Roles & Responsibilities

1) Project Manager

- Plan and implement quality processes
- Relay current project quality status to project staff
- Communicate any quality risks or issues to stakeholders
- Ensure quality control practices are performed at every stage
- Ensure that the project sponsor approves all quality objectives included in the in the Quality Management Plan
- Develop and track project metrics
- Monitor quality activities, resources, and timelines

2) Quality Manager

- Identify and track quality standards and metrics
- Implement quality control techniques to control the quality of the deliverables being produced.
- Implement quality assurance techniques to ensure the quality of deliverables being produced
- Communicate quality risks or issues to the Project Manager

3) Testing Engineer

 Perform User Acceptance testing on the release before production to ensure quality

Quality Assurance

The Compete project will apply a quality assurance process to provide adequate assurance that the software products and processes in the project life cycle meet the specified requirements and follow the established plans.

The Quality Manager and Project Manager will prepare and execute a quality assurance plan containing quality standards, methodologies, procedures, schedules, and responsibilities. To ensure quality, an iterative process will be used for the entirety of the project life cycle.

The Project Manager, Quality Manager and the development team will perform evaluations at intervals throughout the project to make sure that all processes are being correctly executed.

The Quality Manager will oversee day-to-day quality management and carry out process audits on a weekly basis. They will also monitor all the process's metrics and make sure the processes follow the project's standards. If any issues are found, the Quality Manager will meet with the Project Manager and discuss what needs to be done.

The development team will identify, review, and report any issues related to the quality characteristic found in the project deliverables. These characteristics could be anything such as completeness, consistency etc.

Quality Monitoring and Control

This section will describe the methods that will be used to measure, monitor, and control quality of the work processes and products.

- Audits

Audits of work processes can be requested by the Project Manager, CEO, or the Project Sponsor. Once requested, these audits will be done to verify the adherence of procedures and processes as described in the Quality Assurance Plan.

Audits of the software (source code) will be performed to assure that a minimum level of documentation quality exists.

The Project Manager will develop a procedure for requesting an audit and will make it available to the necessary individuals.

Issue Tracking

Defects and other issues will be logged and tracked in a document template prepared by the Project Manager. This document will then be filled out by the Quality Manager after determining the root cause of the issue and possible solutions to mitigate/solve the issue.

The issue will be analyzed using Cause-and-effect diagrams. The quality manager will draw out the possible root causes and attach the diagram alongside the issue in the document prepared by the Project Manager.

- Monitoring Metrics

Quality-specific metrics will be collected and stored in a document prepared by the Project Manager and the Quality Manager. This document will contain a quality metric and the minimum-acceptable-value of this quality metric. If the value of quality metric drops below its minimum-acceptable-value, the Quality Manager will relay the issue to the Project Manager and will prompt an investigation.

5.7 Resource Management Plan

The key resources and Resource Calendar can be found attached with this SPMP Document. Please refer to document DN.1 in the References section (2.4) to view the Key Resources and the Resource Calendar.

The Key Resources can be found by opening the DN.1 mpp file and navigating to the resource sheet.

The Resource Calendar can be found by opening the DN.1 mpp file and navigating to the resource sheet.

The Resource Graph showing the allocation/over-allocation of hours can be found by opening the DN.1 mpp file and navigating to the resource sheet.

5.8 Communication Management Plan

The communication management plan is shown in the communications matrix below.

| Meeting Type | Objective | Medium | Frequen cy | Meeting Lead | Meeting Members | Deliverab le | Format |
|--|---|---|----------------|--------------------|--|---|---------------------------------------|
| Project Team Meeting s | Review status of the project with the team | Face to Face or Conferen ce Call | Weekly | Project Manager | Project Sponsor, Project Team | Agenda, Project Schedule | Document |
| Technic al Meeting s | Discuss and develop technical aspects of the project | Face to Face | As required | Develop er Lead | Developer s, Designer | Agenda | Document s and presentati on |
| Monthly Project Status Meeting s | Report on the status of the project to manageme nt | Face to Face or Conferen ce call | Monthly | Project Manager | Project Sponsor, CEO, Quality Manager, Developer | Project Status Report, Project Schedule | Document s and presentati on |

| Project Status Reports | Report of the status of the project including activities, progress, issues. | Email | Monthly | Project Manager | Project Sponsor, CEO, Project Team | Project Status Report, Project Schedule | Document |
|------------------------------|--|-------|---------|--------------------|--|---|----------|
|------------------------------|--|-------|---------|--------------------|--|---|----------|

All conference calls will be held through Microsoft Teams. Documents will be made available through Microsoft SharePoint to all concerned stakeholders.

5.9 Risk Management

The purpose of risk management is to mitigate the cost of negative risk and its impact on the project deliverables and the project main objectives and aggravate the cost of positive risk also referred to as opportunities. This section will guide the project stakeholders, project manager, project team throughout the project's lifecycle.

After the project initiation, there will be 2 meetings for identifying possible risks. In the first meeting, the project manager, and the CEO of the organization along with a panel of experts will attend and use the Delphi Technique to identify risks and make predictions about future developments of the project. Stakeholders will be among the panel of experts. To avoid bias, there will be repeated rounds of questioning and all attendees can provide anonymous inputs regarding future events of the project. In the second meeting, the project manager and the project team will get together for brainstorming sessions to identify any technical risks related to the project.

Following the project initiation, the team and the project manager will perform Risk Analysis. Risk analysis will be divided into three categories, mainly, quantitative, and qualitative. Risk events will be ranked based on these two categories.

For Qualitative risk analysis, we will use the top 10 risk item tracking table which will be updated every month throughout the course of the project. For the risks that are of low priority we will use a watch list to monitor them regularly. As for quantitative risk analysis, the technique we will use is the simulation technique. More specifically we will make use of Monte Carlo analysis since, this technique is best suited for compete, keeping in mind the duration of the project and its deliverables. This will allow the concerning parties to analyze the expected behavior of the system and view performance metrics.

The project manager is responsible for monitoring risks and reporting to key stakeholders. The project manager will be responsible for tracking the previously identified risks, identifying new risks and perform regular risk management evaluation using the above risk analysis techniques and ensure that all documents pertaining to risk management including the risk register and project management

plan stays up to date. In the event of any change the project manager must request the CCB for approval and consult with key stakeholders if needed.

Microsoft project will be the perform all risk management activities including Monte Carlo analysis. Microsoft Excel will be used to create the risk register spreadsheet for the project.

5.9.1 Risk Register

The following spreadsheet/ table contains all the risk events. The document will also be provided with the SPMP. The document is DN.2, please see References (2.4) for more information if the following images are not sufficient.

| | | | | | | | | | Probability | Impact | |
|---------|------|---------------------------------|--|---------------------|--|---|--|--------------------|--------------------|--------------------|--------------------|

5.10 Stakeholders Management Plan

Internal Stakeholders

- CEO, Project Manager, Project Sponsor, Project Team, Quality Manager

External Stakeholders

- Project's <u>customers</u> and competitors

Analysis of stakeholders' power/interest

| High | High CEO | | |
|-----------------------|--------------|------------------------|--|
| Low | Project Team | Customers, Competitors | |
| Power ↑ Interest → | Low | High | |

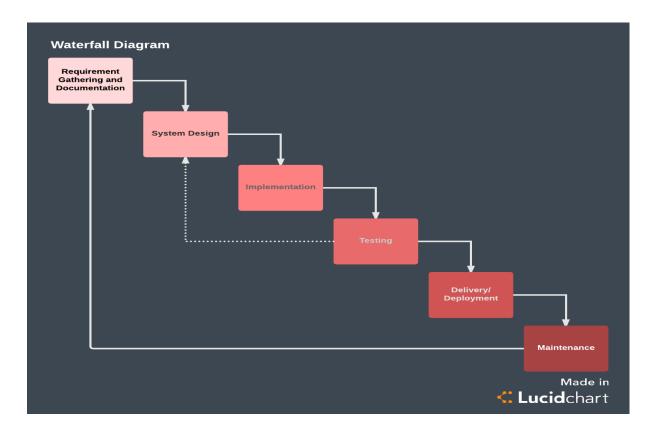

Stakeholders management strategy

- The high-power and high-interest stakeholders will be managed with the utmost care.
- The high-power and low-interest stakeholders will be kept satisfied.
- The low-power and high-interest stakeholders will be kept informed.
- The low-power and low-interest stakeholders require the least effort. So, they will be monitored.

6. Development Process

After discussing with the members of the group for what is the best development process that is suitable for our project, we agreed that we will use waterfall methodology. There is a lot of reasons why we choose waterfall, one of the reasons that make us decide to use waterfall is that we have clear requirements so we will not need to change the requirement in the feature. In waterfall the goal of the project is clear from the start so the members will be aware of the overall goal from the start and this will help the members to work in the right track and not getting lost in the details in the future. The most important reason for choosing waterfall because of the combination between using waterfall and the work breakdown structure (WBS) because it will make managing the tasks easier, also the project planning will be more organized.

So, as you can see from the picture, we can start with gathering the requirement by creating a use case diagram, sequence diagram etc. and documenting the ideas, features, programming language, platforms, goals, and scope. The next phase we will start with the design so we can hire a designer so he can make a rough ketch and after that working on the UI/UX. The third phase we will start developing so we will develop the front and back ends. The fourth phase we will test the whole program. In the fifth phase we will lunch the program, so in this phase we will work on getting the approval to lunch and choosing where the program should be lunched in. In the last phase we will maintain our program so we can publish a survey to the users so we can get some feedback from the users and after that we can work on fixing the issues.

7. Abbreviations and Definitions

| ССВ | Change Control Board |
